

# UL Fire Rated Assemblies for Chicago Metallic® Grid Suspension Systems

UL fire resistance ratings are based upon the test method and acceptance criteria in the ANSI/UL263 (ASTM E119) Standard for Fire Tests of Building Construction Materials. Underwriters Laboratories and their Fire Resistance directory should be consulted for complete up-to-date details when specifying a design.

### General Notes

The hourly rating assigned to grid components, or the ceiling grid systems, cannot be achieved independent of the ceiling assembly of which it is part.

Hanger wire spacing should not exceed the design's stated center spacing but may be less than specified.

The plenum depth stated in each design represents the minimum acceptable plenum depth. Therefore, the plenum depth may be greater, but not less, than specified in the design.

Images shown are a general representation of the assembly, user should visit UL.prospector for full assembly details and information.
